

# Nonparametric combinatorial sequence models

Fabian L. Wauthier, UC Berkeley

with Nebojsa Jojic (MSR) and Michael I. Jordan (UCB)

30<sup>th</sup> March, 2011

## Biological motivation: Sequence variability

Y N Q S E A G S H I I Q R M Y G C D  
Y N Q S E A G S H T L Q R M Y G C D  
Y N Q S E D G S H T I Q I M Y G C D

- Suppose we are given aligned sequences.

## Biological motivation: Sequence variability

Y N Q S E A G S H I I Q R M Y G C D  
Y N Q S E A G S H T L Q R M Y G C D  
Y N Q S E D G S H T I Q I M Y G C D

- ▶ Suppose we are given aligned sequences.
- ▶ Interest in understanding sequence variability:
  - Functional properties, domains, ancestral inference, etc.

## Biological motivation: Sequence variability

Y N Q S E A G S H I I Q R M Y G C D  
Y N Q S E A G S H T L Q R M Y G C D  
Y N Q S E D G S H T I Q I M Y G C D

- ▶ Suppose we are given aligned sequences.
- ▶ Interest in understanding sequence variability:
  - Functional properties, domains, ancestral inference, etc.
- ▶ Many simplifying assumptions in previous work:
  - Site independence: Kingman coalescents, phylogenetic trees.

## Biological motivation: Sequence variability

Y N Q S E A G S H I I Q R M Y G C D  
Y N Q S E A G S H T L Q R M Y G C D  
Y N Q S E D G S H T I Q I M Y G C D

- ▶ Suppose we are given aligned sequences.
- ▶ Interest in understanding sequence variability:
  - Functional properties, domains, ancestral inference, etc.
- ▶ Many simplifying assumptions in previous work:
  - Site independence: Kingman coalescents, phylogenetic trees.
  - Full site dependence: Mixture models

## Biological motivation: Sequence variability

Y N Q S E A G S H I I Q R M Y G C D  
Y N Q S E A G S H T L Q R M Y G C D  
Y N Q S E D G S H T I Q I M Y G C D

- ▶ Suppose we are given aligned sequences.
- ▶ Interest in understanding sequence variability:
  - Functional properties, domains, ancestral inference, etc.
- ▶ Many simplifying assumptions in previous work:
  - Site independence: Kingman coalescents, phylogenetic trees.
  - Full site dependence: Mixture models
  - Sequential stochastic process: HMMs, changepoint models.

## Biological motivation: Sequence variability

Y N Q S E A G S H I I Q R M Y G C D  
Y N Q S E A G S H T L Q R M Y G C D  
Y N Q S E D G S H T I Q I M Y G C D

- ▶ Suppose we are given aligned sequences.
- ▶ Interest in understanding sequence variability:
  - Functional properties, domains, ancestral inference, etc.
- ▶ Many simplifying assumptions in previous work:
  - Site independence: Kingman coalescents, phylogenetic trees.
  - Full site dependence: Mixture models
  - Sequential stochastic process: HMMs, changepoint models.

**Our interest:** sequences where these assumptions do not hold

## Biological motivation: Sequence variability

Y N Q S E A G S H I I Q R M Y G C D  
Y N Q S E A G S H T L Q R M Y G C D  
Y N Q S E D G S H T I Q I M Y G C D

- ▶ Suppose we are given aligned sequences.
- ▶ Interest in understanding sequence variability:
  - Functional properties, domains, ancestral inference, etc.
- ▶ Many simplifying assumptions in previous work:
  - Site independence: Kingman coalescents, phylogenetic trees.
  - Full site dependence: Mixture models
  - Sequential stochastic process: HMMs, changepoint models.

**Our interest:** sequences where these assumptions do not hold

- ▶ Partial, long-range site dependencies

## Example: MHC I proteins

Freeman and Company, 2007

- ▶ MHC I proteins present peptide chains to T-cell receptors.

## Example: MHC I proteins

Freeman and Company, 2007

- ▶ MHC I proteins present peptide chains to T-cell receptors.

## Example: MHC I proteins

Freeman and Company, 2007

- ▶ MHC I proteins present peptide chains to T-cell receptors.

## Example: MHC I proteins

Freeman and Company, 2007

- ▶ MHC I proteins present peptide chains to T-cell receptors.

## Example: MHC I proteins

Freeman and Company, 2007

- ▶ MHC I proteins present peptide chains to T-cell receptors.
- ▶ Peptides originating from virus protein  $\Rightarrow$  destruction of cell.

## Example: MHC I proteins

Freeman and Company, 2007

- ▶ MHC I proteins present peptide chains to T-cell receptors.
- ▶ Peptides originating from virus protein  $\Rightarrow$  destruction of cell.
- ▶ Variability: duplication + mutation + fitness pressure.

## Example: MHC I proteins

Freeman and Company, 2007

- ▶ MHC I proteins present peptide chains to T-cell receptors.
- ▶ Peptides originating from virus protein  $\Rightarrow$  destruction of cell.
- ▶ Variability: duplication + mutation + fitness pressure.

**Our Interest:** model sequence **variability**, not its **origins**.

## Example: MHC I proteins

Freeman and Company, 2007

## Example: MHC I proteins

Freeman and Company, 2007

- Binding site decomposes into pockets (Sidney et al., 2008)  
Expect partial site linkage.

## Example: MHC I proteins

Freeman and Company, 2007

- ▶ Binding site decomposes into pockets (Sidney et al., 2008)  
Expect partial site linkage.  
⇒ **Full site (in)dependence inappropriate**

## Example: MHC I proteins

Freeman and Company, 2007

- ▶ Binding site decomposes into pockets (Sidney et al., 2008)  
Expect partial site linkage.  
⇒ **Full site (in)dependence inappropriate**
- ▶ Variability due to evolutionary pressure on 3D binding site.  
Variable sites are discontinuous ⇒ long-range dependencies.

## Example: MHC I proteins

Freeman and Company, 2007

- ▶ Binding site decomposes into pockets (Sidney et al., 2008)  
Expect partial site linkage.  
⇒ **Full site (in)dependence inappropriate**
- ▶ Variability due to evolutionary pressure on 3D binding site.  
Variable sites are discontinuous ⇒ long-range dependencies.  
⇒ **Markovian analysis inappropriate**

## Our model: high level

|   |   |   |   |   |
|---|---|---|---|---|
| A | T | G | C | G |
| C | T | G | T | G |
| A | C | A | C | G |
| A | C | A | C | A |

**Main idea:** Each sequence is composed of smaller components.

## Our model: high level

**Main idea:** Each sequence is composed of smaller components.

## Our model: high level

**Main idea:** Each sequence is composed of smaller components.

1. Sites grouped into discontinuous, aligned components (gray).

## Our model: high level

**Main idea:** Each sequence is composed of smaller components.

1. Sites grouped into discontinuous, aligned components (gray).
2. Components of a sequence assigned a PSSM (colors).

## Our model: high level

**Main idea:** Each sequence is composed of smaller components.

1. Sites grouped into discontinuous, aligned components (gray).
2. Components of a sequence assigned a PSSM (colors).
3. Symbols sampled from assigned PSSMs.

## Our model: high level

**Main idea:** Each sequence is composed of smaller components.

1. Sites grouped into discontinuous, aligned components (gray).
2. Components of a sequence assigned a PSSM (colors).
3. Symbols sampled from assigned PSSMs.

C.f. Probabilistic index map (Jojic and Caspi, CVPR 2004; Jojic et al., UAI 2004)

## Missing information

**Do not know how many site groups/PSSMs there are!**

# Missing information

**Do not know how many site groups/PSSMs there are!**

- ▶ **Our approach:** put a prior distribution on these unknowns

# Missing information

**Do not know how many site groups/PSSMs there are!**

- ▶ **Our approach:** put a prior distribution on these unknowns
- ▶ **Our model:** A Chinese Restaurant Franchise (CRF) conditioned on a Chinese Restaurant Process (CRP)

# Missing information

**Do not know how many site groups/PSSMs there are!**

- ▶ **Our approach:** put a prior distribution on these unknowns
- ▶ **Our model:** A Chinese Restaurant Franchise (CRF) conditioned on a Chinese Restaurant Process (CRP)
  1. CRP: induces prior on number of site groups.

# Missing information

**Do not know how many site groups/PSSMs there are!**

- ▶ **Our approach:** put a prior distribution on these unknowns
- ▶ **Our model:** A Chinese Restaurant Franchise (CRF) conditioned on a Chinese Restaurant Process (CRP)
  1. CRP: induces prior on number of site groups.
  2. CRF: induces prior on number of PSSMs and shares them among sequences.

## Background: The Chinese Restaurant Process (CRP)

Culinary metaphor: Datapoints are customers; tables are clusters

## Background: The Chinese Restaurant Process (CRP)

Culinary metaphor: Datapoints are customers; tables are clusters

- First customer sits at the first table

## Background: The Chinese Restaurant Process (CRP)

Culinary metaphor: Datapoints are customers; tables are clusters

- ▶ First customer sits at the first table
- ▶ Subsequent customers
  - choose a table with probability proportional to the number of customers sitting at it,
  - or with small probability open a new table.

## Background: The Chinese Restaurant Process (CRP)

Culinary metaphor: Datapoints are customers; tables are clusters

- ▶ First customer sits at the first table
- ▶ Subsequent customers
  - choose a table with probability proportional to the number of customers sitting at it,
  - or with small probability open a new table.
- ▶ **Key point:** The number of tables is random and inferred.

# Background: The Chinese Restaurant Process (CRP)

Culinary metaphor: Datapoints are customers; tables are clusters

- ▶ First customer sits at the first table
- ▶ Subsequent customers
  - choose a table with probability proportional to the number of customers sitting at it,
  - or with small probability open a new table.
- ▶ **Key point:** The number of tables is random and inferred.
- ▶ **For us:** Infer the number of site groups.

## Background: The Chinese Restaurant Franchise (CRF)

- ▶ CRF = “multiple coupled CRPs”

## Background: The Chinese Restaurant Franchise (CRF)

- ▶ CRF = “multiple coupled CRPs”
- ▶ One restaurant per dataset. Customers seated by CRP rules.

## Background: The Chinese Restaurant Franchise (CRF)

- ▶ CRF = “multiple coupled CRPs”
- ▶ One restaurant per dataset. Customers seated by CRP rules.
- ▶ Global menu of “dishes”

## Background: The Chinese Restaurant Franchise (CRF)

- ▶ CRF = “multiple coupled CRPs”
- ▶ One restaurant per dataset. Customers seated by CRP rules.
- ▶ Global menu of “dishes”
- ▶ Each newly opened table assigned a dish
  - First table assigned first dish in menu

# Background: The Chinese Restaurant Franchise (CRF)

- ▶ CRF = “multiple coupled CRPs”
- ▶ One restaurant per dataset. Customers seated by CRP rules.
- ▶ Global menu of “dishes”
- ▶ Each newly opened table assigned a dish
  - First table assigned first dish in menu
  - Subsequent tables
    - ▶ assigned a dish with probability proportional to the number of past tables that were assigned that dish,
    - ▶ or with small probability assigned a new dish at random.

# Background: The Chinese Restaurant Franchise (CRF)

- ▶ CRF = “multiple coupled CRPs”
- ▶ One restaurant per dataset. Customers seated by CRP rules.
- ▶ Global menu of “dishes”
- ▶ Each newly opened table assigned a dish
  - First table assigned first dish in menu
  - Subsequent tables
    - ▶ assigned a dish with probability proportional to the number of past tables that were assigned that dish,
    - ▶ or with small probability assigned a new dish at random.
- ▶ **Key point:** The number of distinct dishes and sharing pattern is random and inferred.

# Background: The Chinese Restaurant Franchise (CRF)

- ▶ CRF = “multiple coupled CRPs”
- ▶ One restaurant per dataset. Customers seated by CRP rules.
- ▶ Global menu of “dishes”
- ▶ Each newly opened table assigned a dish
  - First table assigned first dish in menu
  - Subsequent tables
    - ▶ assigned a dish with probability proportional to the number of past tables that were assigned that dish,
    - ▶ or with small probability assigned a new dish at random.
- ▶ **Key point:** The number of distinct dishes and sharing pattern is random and inferred.
- ▶ **For us:** Infer the number of PSSMs and sharing pattern.

# Inference

- ▶ Inference algorithm: collapsed Gibbs sampler.

# Inference

- ▶ Inference algorithm: collapsed Gibbs sampler.
- ▶ Varying hyperparameters varies posterior model “complexity.”

# Inference

- ▶ Inference algorithm: collapsed Gibbs sampler.
- ▶ Varying hyperparameters varies posterior model “complexity.”
- ▶ Given posterior complexity, compare average model likelihood with that of a mixture model with similar complexity.

# Inference

- ▶ Inference algorithm: collapsed Gibbs sampler.
- ▶ Varying hyperparameters varies posterior model “complexity.”
- ▶ Given posterior complexity, compare average model likelihood with that of a mixture model with similar complexity.
- ▶ Look at three datasets: blue = our model, red = mixture.

# Predicting phenotypic quantities

- ▶ Let binary vector  $m_{ik}$  encode latent variables of sequence  $s_i$  for posterior sample  $k$ .
  - $m_{ik}$ : which sequence position was assigned which PSSM

# Predicting phenotypic quantities

- ▶ Let binary vector  $m_{ik}$  encode latent variables of sequence  $s_i$  for posterior sample  $k$ .
  - $m_{ik}$ : which sequence position was assigned which PSSM
- ▶ Similar sequences have similar encodings; can use  $m_{i\cdot}$  to share phenotype information.

# Predicting phenotypic quantities

- ▶ Let binary vector  $m_{ik}$  encode latent variables of sequence  $s_i$  for posterior sample  $k$ .
  - $m_{ik}$ : which sequence position was assigned which PSSM
- ▶ Similar sequences have similar encodings; can use  $m_{i\cdot}$  to share phenotype information.
- ▶ Example: binding affinities of MHC I proteins

# Predicting phenotypic quantities

- ▶ Let binary vector  $m_{ik}$  encode latent variables of sequence  $s_i$  for posterior sample  $k$ .
  - $m_{ik}$ : which sequence position was assigned which PSSM
- ▶ Similar sequences have similar encodings; can use  $m_i$  to share phenotype information.
- ▶ Example: binding affinities of MHC I proteins
  - Peptide encoding  $p_j$ , affinity  $y_{ij}$

$$y_{ij} = p_j^\top \Theta_k m_{ik} = \text{trace}(\Theta_k m_{ik} p_j^\top).$$

# Predicting phenotypic quantities

- ▶ Let binary vector  $m_{ik}$  encode latent variables of sequence  $s_i$  for posterior sample  $k$ .
  - $m_{ik}$ : which sequence position was assigned which PSSM
- ▶ Similar sequences have similar encodings; can use  $m_i$  to share phenotype information.
- ▶ Example: binding affinities of MHC I proteins
  - Peptide encoding  $p_j$ , affinity  $y_{ij}$

$$y_{ij} = p_j^\top \Theta_k m_{ik} = \text{trace}(\Theta_k m_{ik} p_j^\top).$$

- Learn  $\Theta_k$  for each sample  $k$ . Then average predictions.
- Predict binding/non-binding peptides  $\Rightarrow$  AUC score

# Results

- ▶ Information transfer

# Results

- Information transfer

| Method        | AUC    |
|---------------|--------|
| Independent   | 0.8290 |
| Transfer only | 0.7285 |
